Greek Aegean & Ionian Seas

Maria Papazekou

Funded by
the European Union

Key characteristics and planning objectives

- **Location:** Eastern Mediterranean
 - **Boundaries:** Greece's MSP Implementation Area (Temporary EEZ)
 - *Not a transboundary PS
 - MPAs cover ~**18%** of the country's territorial waters ⇒ **>35%** after the establishment of two new Marine Parks
-  • No areas of strict protection
- No protection beyond territorial waters

Develop scenarios on EB-MSP to meet EU Biodiversity Strategy for 2030 targets of protecting 30% and strictly protecting 10% of national waters.

Key characteristics and planning objectives

Predefined Scenarios

Climate Change: National legislation for climate neutrality and adaptation

OECMs: Minimize restrictions on human activities

Realistic Scenario: developed based on national and European commitments

Connectivity & 3D Planning: Recently tested in practice. Counteract the lack of many deep-sea MPAs and the fragmented nature of the MPA network

Key characteristics and planning objectives

Basic Components

Ecological Features: 68 biodiversity presence and distribution data layers were compiled under the EBSA criteria

Cost layers: Proxy layers representing the intensity of area use by profitable sectors

Additional Components

Included in the realistic scenario

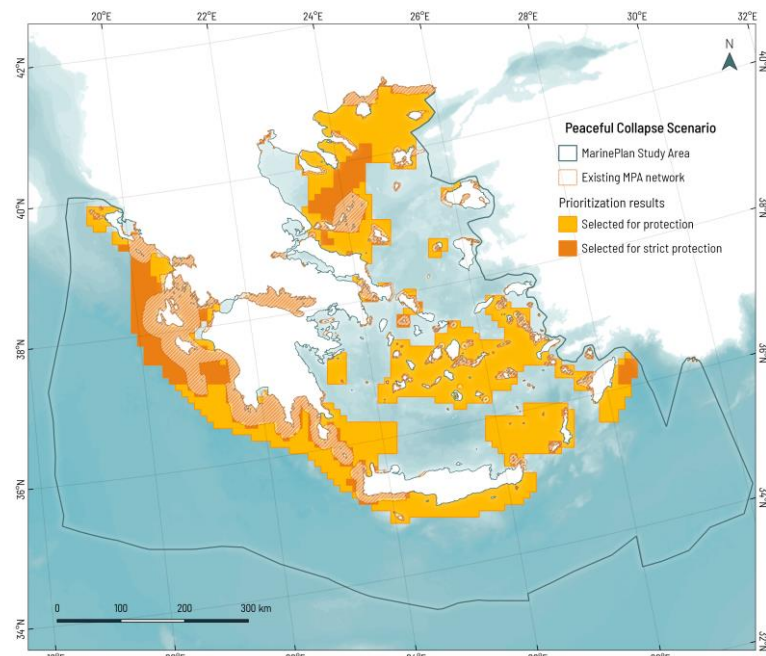

- **3D Planning:** prior3D
- **Connectivity:** priorCON
- **OECMs:** MCDA tool for OECM assessments
- **Climate Change:** Climate Refugia, Marine Heatwaves, Invasive Species
- **Lock-in Areas:** Existing MPA network

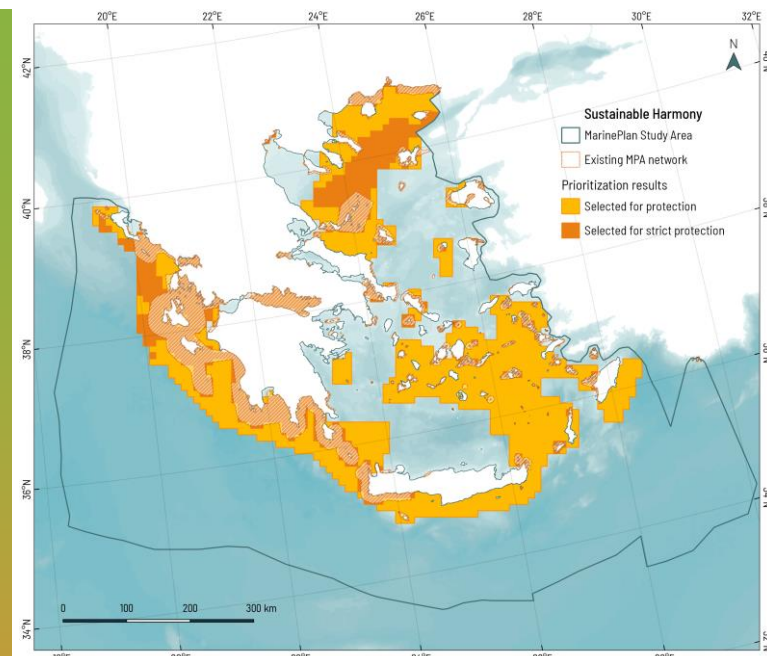

Key results

Predefined Scenarios

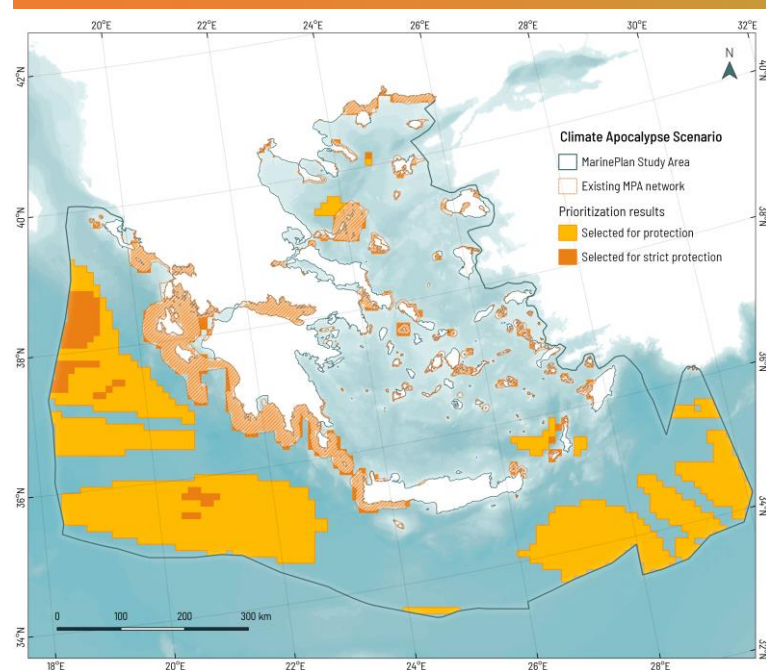

- Some priority areas emerge consistently across scenarios → foundation for long-term conservation planning.
- Undersurveyed (offshore) areas are deprioritized.
- Cost functions and weighting schemes shape outcomes, especially for strict protection.

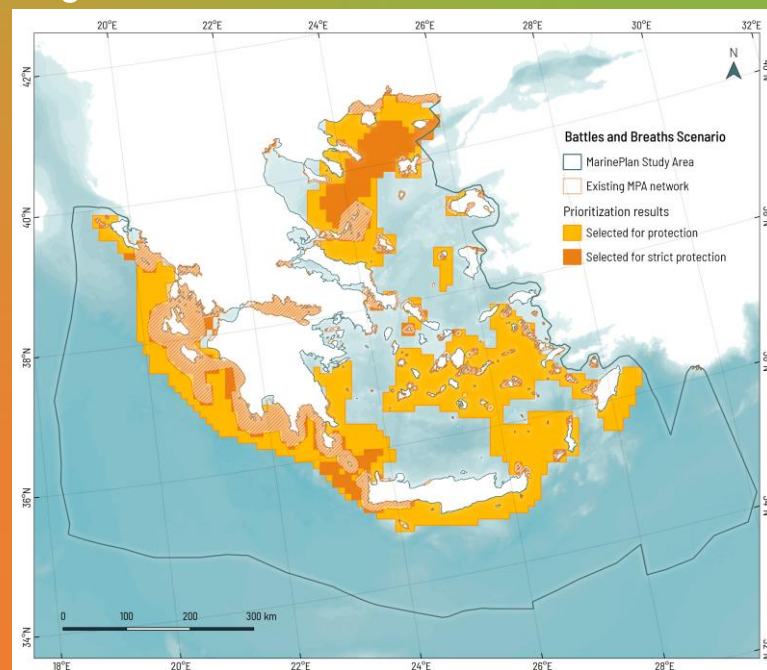

Politics

Climate change

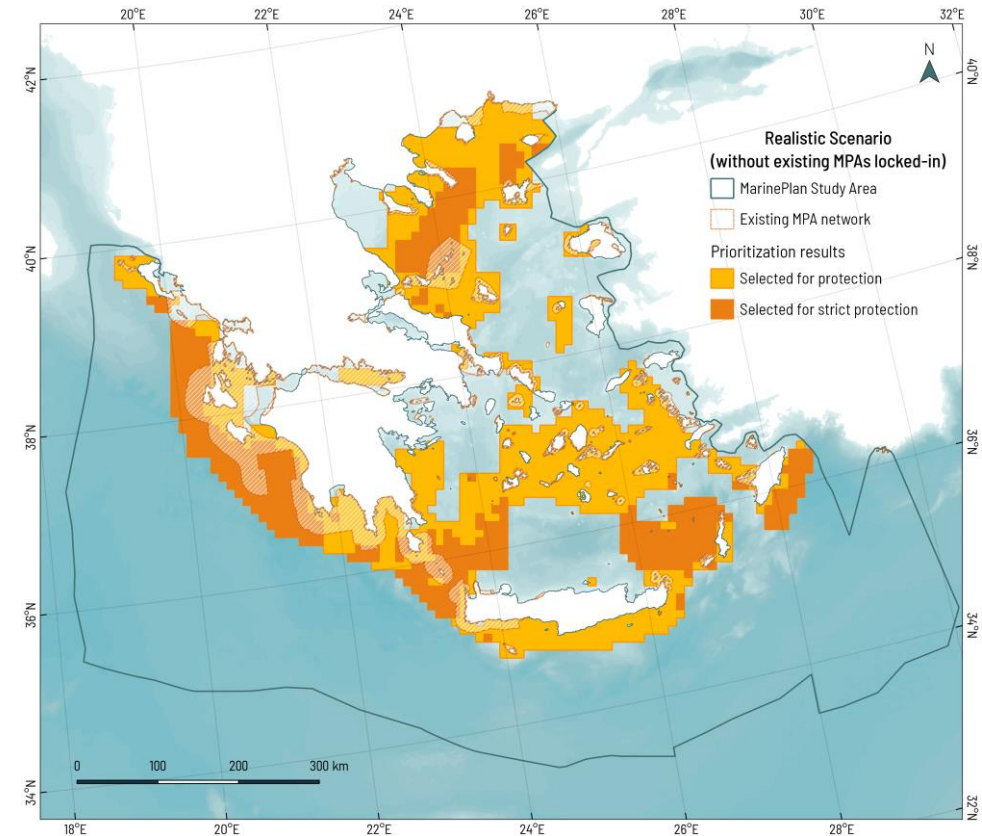

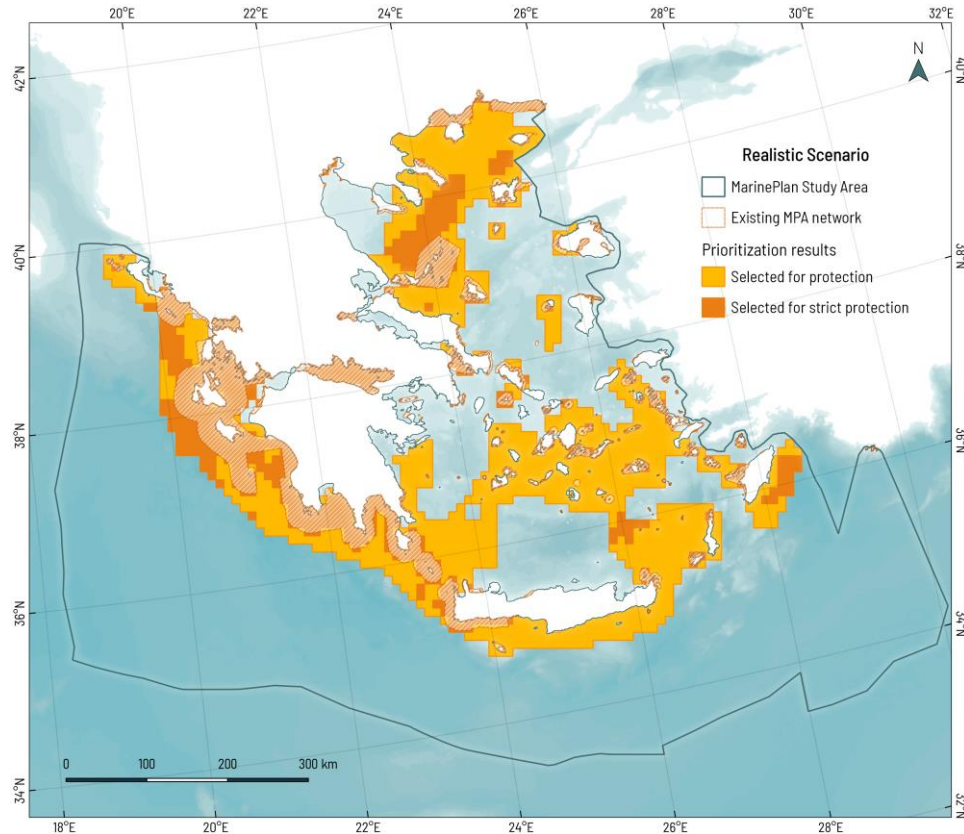

International

Key results

Realistic Scenario

 Existing MPA network 

- Realistic Scenario balances **ambition with feasibility**.
 - Opportunities for **MPA network expansion**.
- The existing MPA network is **not always prioritized**.
 - Biggest differences in **strict protection** areas.

Key Challenges

- **Lack of ecological feature distribution:** Bias towards coastal zones & current MPA network ⇒ Challenge for expanding MPAs beyond territorial waters

- **Fill data gaps** in regions with limited surveys
- Highlight conservation value of undersurveyed areas using **alternative approaches** (e.g., 3D planning)

- **Lack of cost data:** Detailed socio-economic data for human activities is missing

- Spatially explicit **monetary valuation**
- Incorporate **social well-being and ecosystem service valuation** at sea

- **Spatial scale:** Limited applicability to real-world contexts

- Deliver **finer-scale results**, at least for nearshore areas, to enhance relevance of outcomes

Lessons learnt and opportunities

- **Data availability** constrains planning ⇒ Undersurveyed areas need higher priority to address sampling bias.
- **Political and social realities** must be considered alongside prioritization.
- Weighting biodiversity and human-use parameters requires **local context**.
- Revisit **individual components** driving prioritization to support trade-off analysis and practical decision-making.

Scenarios vs MSP/Conservation planning

- MSP has not been implemented in Greece ⇒ **No contradiction** with our results
- **Integrate MSP and MPA** processes under a shared, spatial, data-driven foundation
- **Multi-scenario testing to**
 1. identify biodiversity-important areas for MPA network expansion
 2. ensure preparedness under global change
- Account for OECMs, connectivity, and climate change to **build ecological resilience** while **reducing conflicts** with key economic activities
- Expand protection to include **deep-sea habitats**, complementing the current nearshore-focused MPA network

Thank you!
